

WORLD CLASS DENTIST

A highly successful prosthodontic specialist aiming to provide you with the best dental care possible.

Internationally recognised inventor, innovator and academic clinician Professor Neil Meredith has over 25 years experience in treating patients with dental implants, and has been a major part of the evolution of modern implant dentistry. The highly successful and sought after solution for replacing missing teeth is popular Australia wide, and takes the stress and worry out of losing a tooth.

As a prosthodontic specialist holding two PhDs, Professor Meredith invented the internationally recognised technology to measure dental implant success, which is

most commonly known as Osstell. In addition, he has designed a complete dental implant system, managing the company from start-up to a now international business sold in over ten different countries.

Professor Meredith's passion lies in treating patients to the best of his ability and teaching important skills to those who need it. He has some concerns that the high level of success the treatments have had could be marred by a lack of experience, inferior components, and untreated peri-implant disease.

To ensure this treatment maintains

PROFESSOR NEIL MEREDITH

credibility and is performed with the highest of skills, Professor Meredith will be opening his own dental implant and complications clinic here in Brisbane in 2019.
